Motivation

1. Text-based references can drift between similar objects. Coordinate-only grounding lacks explicit identity tracking.

2. A model may correctly analyze object A, then silently point to object B. This reasoning-to-answer misalignment breaks reliable visual grounding.

Key Insight: Persistent Identity

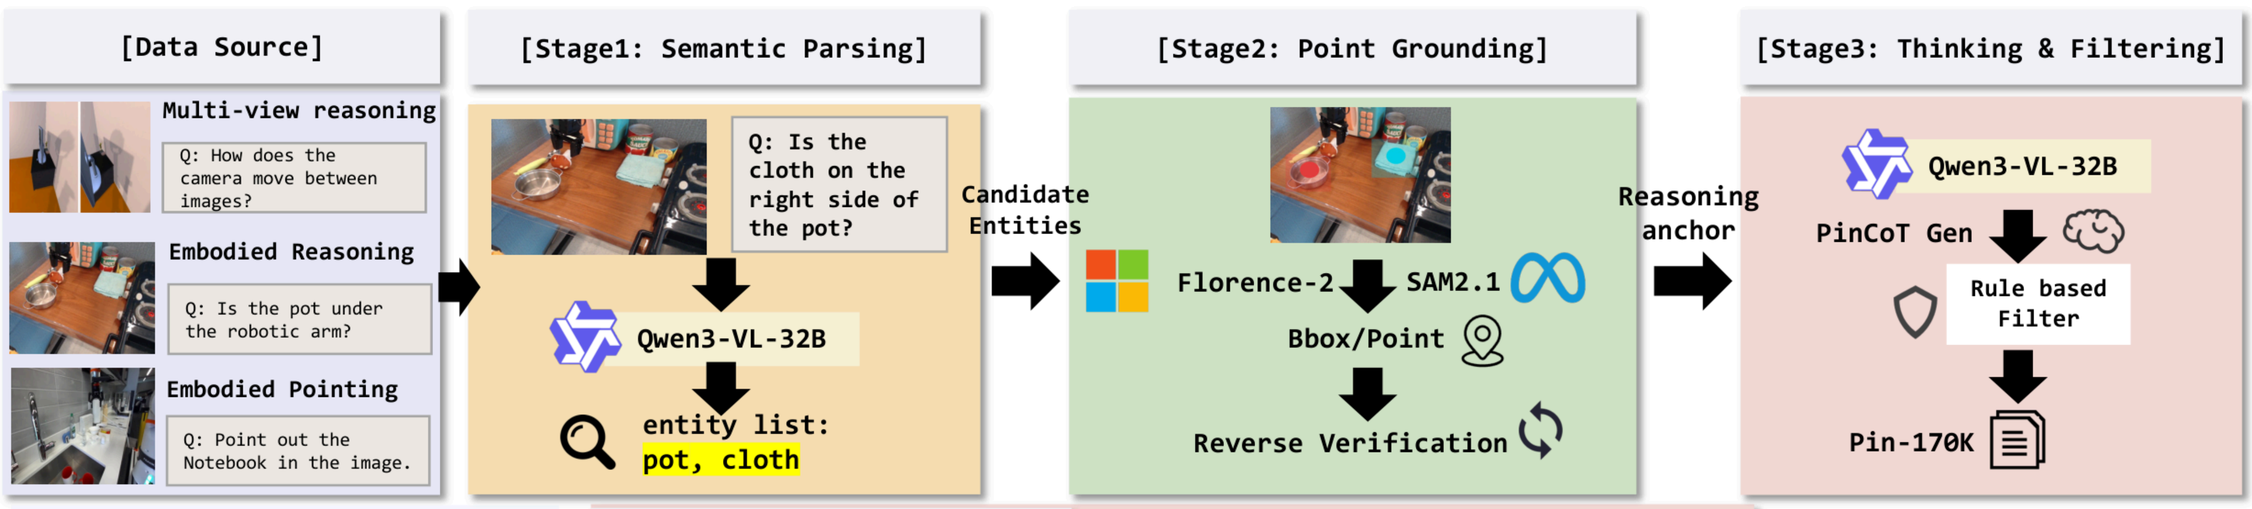

From isolated grounding to persistent anchors

- **Spatial references are usually isolated annotations, without explicit identity tracking during reasoning.**
- **PinCoT binds each entity to a name, ID, view and point. Later steps reuse the same ID.**
- **Our insight: visual anchors act as persistent reasoning variables, making each step traceable to visual evidence.**

PAPER / CODE

Our Method: RoboPIN / PinCoT

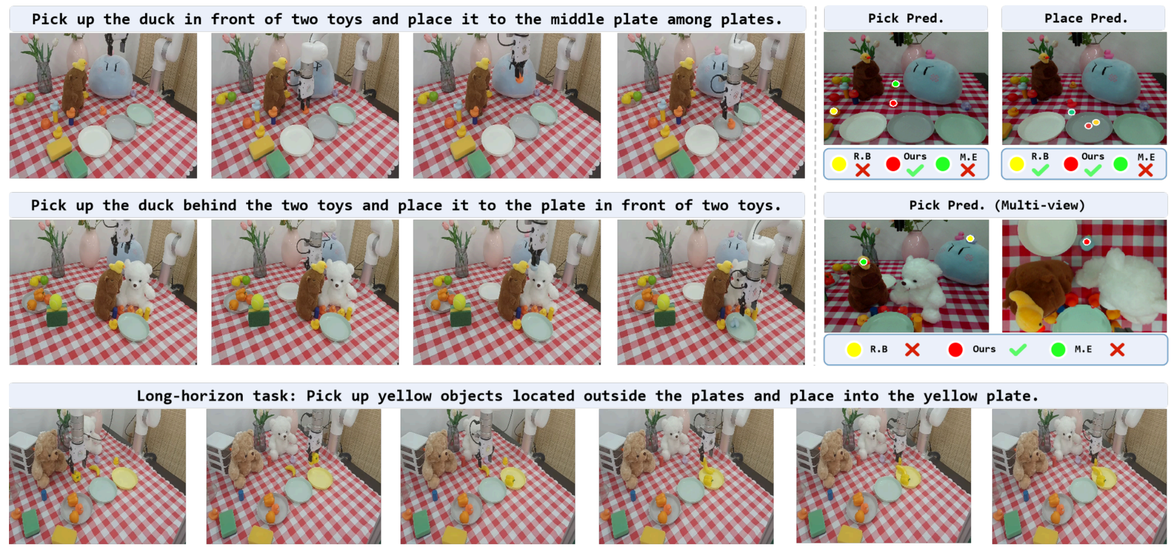

We propose PinCoT, which pins every reasoning step to visual evidence through persistent identity-aware anchors.
RoboPIN learns this representation through SFT, CoT-SFT and process-supervised RFT / GRPO.

Experimental Results

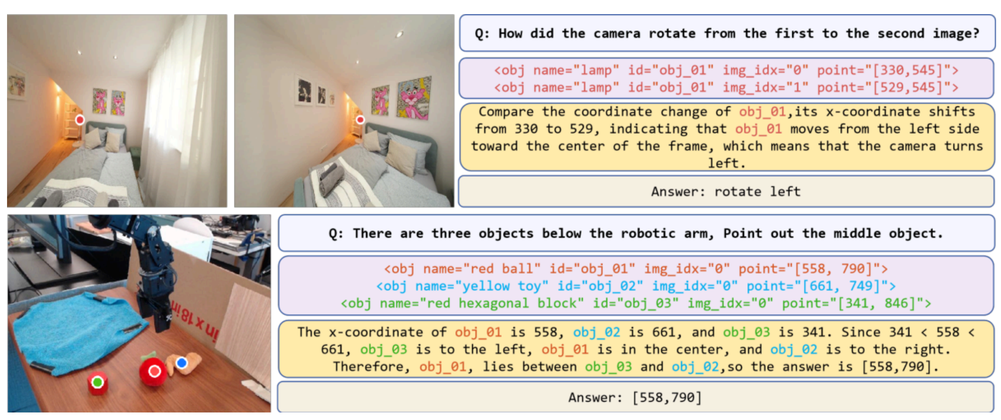

Qualitative Results

Zero-shot xArm · successes / 20

20 / 20	14 / 20	11 / 20
Spatial	Multi-view	Long-horizon

Ablation studies

Reward design

Setting	EmbSpatial
Full reward	**84.7**
w/o Pin	82.0
w/o Consistency	82.7

Training stages

Stage	Spatial	Point
SFT	57.0	66.0
+ CoT-SFT	62.0	63.6
+ RFT	**67.7**	**67.9**

Spatial reasoning: +10.7 points from SFT to RFT.
